This book is a good follow-up to Linear Algebra: A Geometric Approach by Sernesi (Chapman & Hall), which is "introductory" (although not really for the rank beginner) and mostly focuses on affine geometry. If you're looking for a geometric supplement for an introductory course, try A Vector Space Approach to Geometry by Hausner (Dover).

Geared toward upper-level undergraduates and graduate students, this text establishes that projective geometry and linear algebra are essentially identical. The supporting evidence consists of theorems offering an algebraic demonstration of certain geometric concepts. These theorems lead to a reconstruction of the geometry that constituted the discussion's starting point. 1952 edition.

The quality of Dover books is highly variable. Jacobson's Algebra I and II are very good algebra texts, almost as good as classic graduate texts such as Dummit and Foote. Also, Artin's "Galois Theory" is published by Dover, and it is excellent. Dover publishes "Counterexamples in Analysis" and "Counterexamples in Topology," which are great for ...

Algebra can essentially be considered as doing computations similar to those of arithmetic but with non-numerical mathematical objects. However, until the 19th century, algebra consisted essentially of the theory of equations. For example, the fundamental theorem of algebra belongs to the theory of equations and is not, nowadays, considered as belonging to algebra (in fact, every proof must use ...

In geometry and algebra, a real number is constructible if and only if, given a line segment of unit length, a line segment of length $|x|$ can be constructed with compass and straightedge in a finite number of steps. Equivalently, x is constructible if and only if there is a closed-form expression for x using only the integers 0 and 1 and the operations for addition, subtraction, multiplication ...
