Handbook for Bolted Joint Design NCSX-CRIF-BOLT-00 4 2.3.1 Recommended preload The preload should be set to avoid permanent deformation in the bolt. The recommended maximum preload PO is $p \leq \frac{t}{A} \cdot P \cdot c \cdot 0.9 \cdot \sigma_{max}$, where $\sigma_{p.s}$ = proof strength of bolt (ψ SI) c_u = 0.75 for reusable connections, 0.9 for permanent connections.

High strength black bolts (grade 8.8) may also be used in connections in which the bolts are tightened snug fit. In these bearing type of connections, the plates are in firm contact but may slip under loading until the hole surface bears against the bolt. The load transmitted from plate to bolt is therefore by bearing and the bolt is in shear.

Thread shear is an important failure mode for a bolted joint, and occurs when the threads shear off of either the bolt (external thread shear) or off of the nut or tapped part (internal thread shear). There should be enough engagement between the bolt threads and internal threads that the bolt fails in tension before the threads shear.
