A split-ring resonator (SRR) is an artificially produced structure common to metamaterials. Their purpose is to produce the desired magnetic susceptibility (magnetic response) in various types of metamaterials up to 200 terahertz. These media create the necessary strong magnetic coupling to an applied electromagnetic field, not otherwise available in conventional materials.

Technically, the microwave section resembles a “Colpitt oscillator,” with the requisite inductor (and capacitors) made by circuit board traces. The inductor (~10 nH) is the S curve trace on the top surface, and capacitors are the ring structure on the bottom surface and also the rectangular block to the left of the S curve.
