1.1. Distribution of pesticides in the size particle fractions. CUPs can reach the atmosphere during or after pesticide application in agricultural practices from three different emission sources. Firstly, “ spray drift ” occurs during its application. A fraction of the dosage applied to the target area could be deposited onto the adjacent non-target areas and another fraction can be lost in the atmosphere.

Pesticides Found in the Atmosphere. Most pesticides that have been studied in the atmosphere have been detected, and many pesticides from several different chemical groups have been detected at more than half the sites sampled nationwide (see Figure 3). Results for different groups and individual pesticides reflect a range of influencing factors.

1. Introduction. Persistent organic pollutants (POPs), such as organochlorine pesticides (OCPs) and polychlorinated biphenyls (PCBs), are chemicals which have been widely used in agricultural and industrial practices, and have been of great global concern during the past decades because of their toxicity, environmental persistence and potential for long-range transport (Stockholm Convention ...

Some pesticides also emit volatile organic compounds that react with other chemicals in the atmosphere and create tropospheric ozone, a greenhouse gas that affects how long methane and other hydrocarbons remain in the atmosphere. In order to prevent pesticides from being carried through the air, many countries have implemented regulations that ...
